Thermal & Optical Bi-spectrum Network Camera

ON-T09288 Thermal & Optical Bi-spectrum Network Camera, which is capable of highly accurate body temperature measurement, to within ± 0.3 °C, The camera features a built-in AI algorithm for multi-person measurements up to 3m distances, enabling fast and non-contact access. Perfect for adjunct use in hospitals, sub-acute health settings, public areas (i.e. airports), and more. Also can be widely used in close-range scene monitoring, such as indoor fire prevention, warehouse fire prevention, charging pile temperature monitoring and other fields.

High Volume of Management

Large Mobility

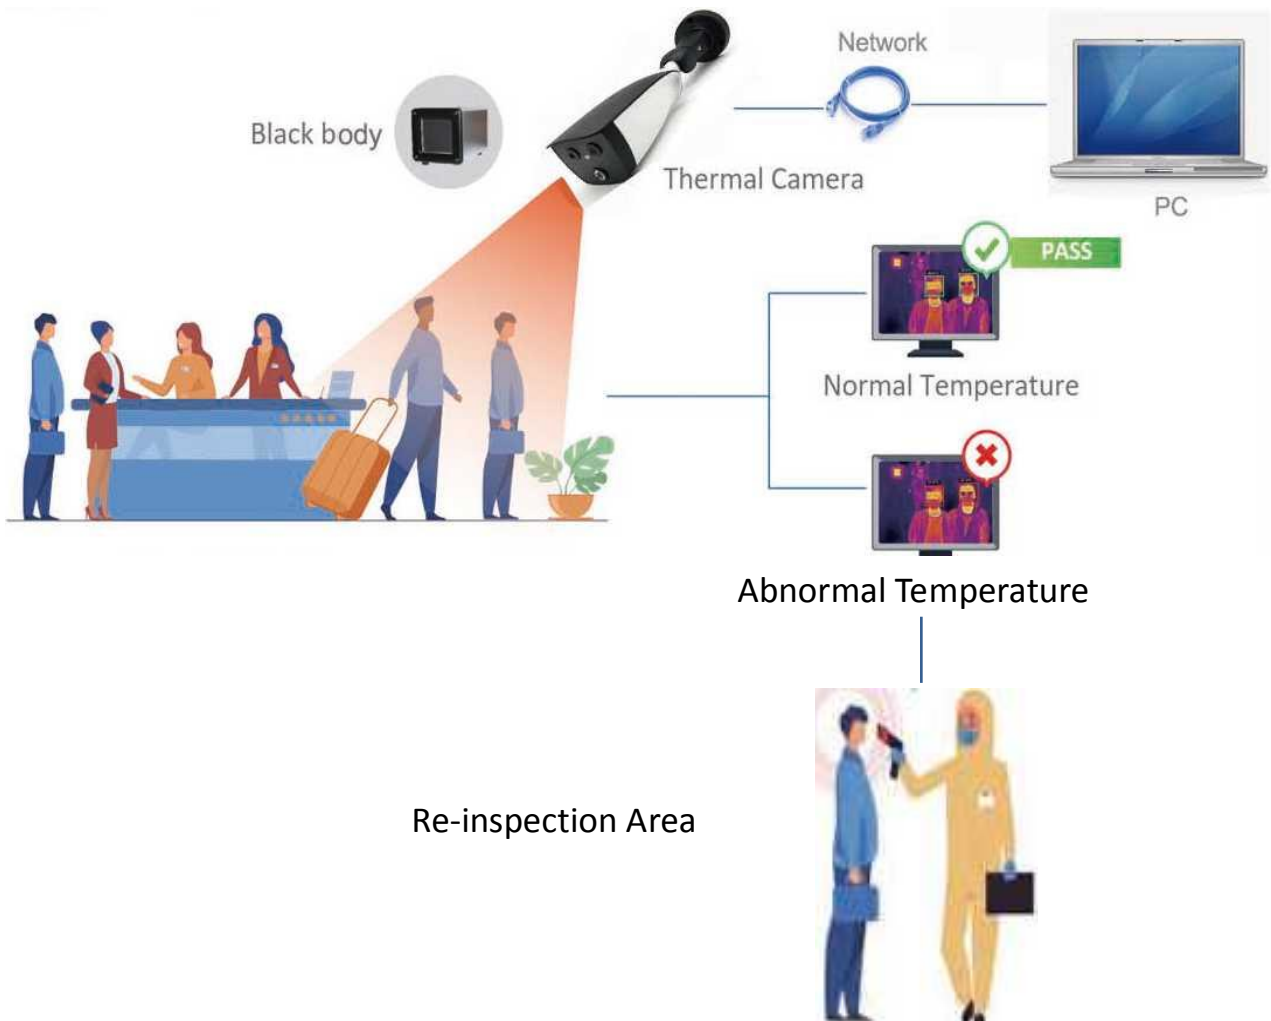

Cross Infection

Present Situation

During the epidemic, entrances and exits in public places basically use manual close-inquiries, manual body temperature measurement, manual registration, and personal mobile phone declarations as methods to prevent and control the epidemic. This management method requires a large number of staffs, plus, staffs' self-protection standards are not uniform, which is easy to cause cross -infection. In addition, the information of the tested personnel is not comprehensive, and in the event of anew epidemic, there is no good traceability mechanism.
